                                                                                                                                                                                                                                                                                                                                                                                                                                                      streptococc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Jackson K.W., Tang J.;
"Complete amino acid sequence of streptokinase and its homology with
"Complete amino acid sequence of streptokinase and its homology with
serine proteases.";
Blochemistry 21:6520-6625(1982).
-!- FUNCTION: This protein is not a protease, but it activates
plasminogen by complexing with it. As a potential virulence
factor, it is thought to prevent the formation of effective fibrin
barriers around the site of infection, thereby contributing to the
invasiveness of the cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MEDLINE=85232082; PubMed=2989113; DOI=10.1016/0378-1119(85)90145-3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Malke H., Roe B.A., Ferretti J.J.; "Nucleotide sequence of the streptokinase gene from Streptococcus equisimilis H46A.";

C. -! FUNCTION: This protein is not a protease, but it activates plasminogen by complexing with it. As a potential virulence factor, it is thought to prevent the formation of effective fibrin barriers around the site of infection, thereby contributing to the invasiveness of the cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This Swiss-Prot entry is copyright. Draft entry and hard copy of sequence for [1] kindly provided by J.J.Ferretti, 03-58P-1985.
J.J.Ferretti, 03-58P-1985.
The -35 and -10 regions are located at positions 760-765 and 781-786 respectively and an SD sequence at 808-813. Downstream from the coding region inverted repeats (positions 2176-2190 and 2203-2217) are thought to function as transcription terminators. The nucleotide sequence of sec does not support the hypothesis that the gene has evolved by duplication and fusion, as suggested by internal two-fold AA homologies of its product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /translation="MKNYLSPGMFALLPALTFGTVNSVQAIAGPEWILDRPSVNNSQL
